

Finding a Site

1

SLOPE CONDITIONS

Choose a lot with a natural slope at least slightly downwards towards the north, northeast, or east for optimal results. Level lots are also acceptable. Modest slopes in other directions - check with us!

2

SUNRISE CONSIDERATION

Avoid sites with taller hills to the east, as they block the beneficial influence of the rising sun. We will calculate the exact sunrise delay during a formal site evaluation.

3

NEARBY ENVIRONMENT

A peaceful, residential environment is most ideal. Steer clear of lots near high tension power lines, and we will check other local factors as part of the formal evaluation.

4

LOT ENTRANCE

Ensure that the entrance into the house and the Vastu fence can face to the east or north, with east being ideal.

5

FORMAL SITE EVALUATION

If a homeowner's association governs the parcel, confirm that you can build a fence surrounding the entire property. Then send the location to us for formal evaluation!
